

. Django Project vs App (VERY common)

Q. What is a Django project?

A project is the full Django setup. It contains settings, URLs, and manages multiple apps.

Q. What is a Django app?

An app is a small module that does one specific job, like a todo app or user app.

Simple line: One project can have multiple apps.

2. MVT Architecture (Explain clearly)

Q. Explain Django MVT.

Model handles database, View handles logic, and Template handles the UI.

Deep understanding:

Model → database table

View → receives request, processes data

Template → shows HTML to user

one-liner:

Django separates data, logic, and UI for clean code.

. Models (go deeper)

Q. What is a model in Django?

A model is a Python class that defines database structure using fields.

Common fields you should know:

CharField

TextField

BooleanField

DateTimeField

ForeignKey

Q. What happens when you change a model?

We run makemigrations and migrate to update the database.

Explain migration simply:

Migrations convert Python model changes into database changes.

. ORM (very important)

Q. What is Django ORM?

ORM allows us to interact with the database using Python instead of SQL.

Examples you can explain (no code needed):

Create object

Fetch all objects

Filter objects

Update object

Delete object

One strong line:

ORM makes database operations easier and database-independent.

. Views (deep but simple)

Q. What is a view?

A view is a function or class that receives a request and returns a response.

Types of views:

Function-Based Views

Class-Based Views

Which did you use?

I mainly used function-based views because they are easier to understand as a beginner.

. URLs (don't miss this)

Q. Why are URLs important?

URLs connect user requests to specific views.

Deep idea:

When a user opens a page, Django checks URLs and calls the matched view.

Extra point (good impression):

Using app-level URLs helps keep the project organized.

. Templates (HTML + Django)

Q. What are templates?

Templates are HTML files with Django template language to display dynamic data.

Things you must know:

Variables

for loop

if condition

extends / block

One line:

Templates separate backend logic from frontend design.

. Forms (from your CRUD app)

Q. How do forms work in Django?

Forms handle user input, validation, and submission.

Types:

Form

ModelForm

Why ModelForm?

It reduces code and automatically maps fields from models.

. GET vs POST (deep clarity)

GET:

Used to fetch data

Data visible in URL

POST:

Used to submit data

More secure

Strong line:

GET is for reading data, POST is for changing data.

Security basics (short but powerful)

Q. What is CSRF?

CSRF protects forms from unauthorized requests.

Say this:

Django provides CSRF tokens by default for form security.

Admin Panel (important)

Q. Why use Django admin?

Admin provides a ready-made interface to manage database records.

Extra:

We register models in admin.py to make them visible.

1. Common “thinking” question

Q. Why did you choose Django?

Django helps build applications faster with built-in security, ORM, and clean structure.
